MMZ – Digital Signal Line Application **MPZ** – Power Supply Line Application

MATERIAL CHARACTERISTICS:

A Material: This high-impedance product is based on the impedance frequency characteristics of our Y-material. The product offers excellent impedance characteristics, which is greater than 2500Ω, in the vicinity of 100MHz range (MMZ1608A252B).

B Material: This type is perfectly suited for fast digital signals. By equalizing R components and X components that beads possess at a frequency of 5MHz, it is able to suppress overshooting, undershooting and ringing of fast digital signals.

D Material: For applications calling for low insertion loss at low frequencies and sharply increasing impedance at high frequencies. Designed for high impedance at high frequencies (200 ~ 500MHz) for signal line applications.

F Material: This new product inherits the characteristic of the D Material, namely its sharp impedance rise time, and its impedance peak frequency has been shifted higher into range. The product offers excellent noise suppression from 600MHz to as high as in the GHz range.

R Material: For digital signal line applications.

S Material: For signal line applications in which the blocking region is near 100MHz.

Y Material: High frequency range type intended for the 100MHz region and above. For signal line applications in which the signal frequency is far from the cutoff frequency.

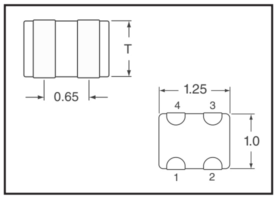
NEW! Chip Beads (SMD Array) For Audio / USB1.1 Signal Line

MCZ Series

Dimensions in mm



This is a common type bead product that removes the noise components in a signal line and includes beads for two lines in a single chip. The product exhibits substantial impedance characteristics in the high frequency range and is therefore capable of effectively removing differential mode noises. Additionally, an appropriate amount of magnetic coupling is created between the beads of the two lines, giving the product the capability to remove not only differential mode noise but common mode noise as well.

Operating Temperature Range: -40°C ~ 85°C

Applications: • Audio signal lines used in cell phones and mobile audio devices • Personal computers and peripheral equipment • PDA • Digital camera

3-Terminal Filters for Signal Line and DC Power Line / SMD

ACF and ACH Series

Features: • The ACF and ACH series are T-type EMC filters incorporating ferrite chip beads and multilayer ceramic chip capacitors. • The external structure consists entirely of ferrite, enabling these parts to achieve superior attenuation characteristics despite their extremely compact dimensions. • Because they can be mounted on edge, the ACF and ACH series are ideal for high-density circuit configurations.

3-Terminal Filters for Signal Line / SMD

MEM2012D Series

Dimensions in mm

This chip type EMC filter eliminates the noise component from a communication line. This noise component can be eliminated by inserting these products in series with the communication line. In comparison to earlier multilayer chip EMC filters, signal wave-form distortion is low after the signal has passed through the filter. Therefore this filter can be used for high speed pulse signal circuits and wide band analog RGB circuits.

Features: • Small size • Steep attenuation characteristic • Low distortion of signal after passing through filter • Capable of reflow soldering

Applications: • PCs • CRTs • LC display panels • Printers • Game machines • DVD equipment

Operating Temperature Range: -40°C ~ 85°C

TAIYO YUDEN

Multilayer Ferrite Chip Beads

Features: • Internal silver printed layer creates a closed circuit which acts as a magnetic shield minimizing heat generation and crosstalk • No need for grounding provides greater circuit design flexibility • Several material types and a broad range of impedance values provide noise countermeasures for various applications

Applications: • High frequency noise countermeasure in personal computers, digital cameras and other information system products • For use on digital product clock lines and general signal lines • Radiated noise suppression in computer or printer interfaces and harness connectors • Noise suppression in video and other AV products • Prevents interference between circuits in cellular phones • Due to the closed internal circuit which acts as a magnetic shield, the TS material is extremely effective as a noise filter on LSI power supply lines where downsizing of components is needed

Taiyo Yuden's Type Breakout:

- **HS:** Suppresses the XL component. Helps stop the reduction of the wave-form integrity. (digital wave-form overshoot, etc.)
- **HM:** Increases the Z characteristic sharply above 20MHz and is applicable for radiated noise in the 100MHz ~ 300MHz range. Especially effective on video signal lines.
- **LL:** Designed as a noise countermeasure for the 200MHz ~ 500MHz range where the rise of the Z component is in the high frequency area.
- **LM:** Intended for noise suppression around 200MHz. Effectively increases attenuation.
- **HW:** The best material in the BK Series to suppress the XL component and stop the reduction of the wave-form integrity while maintaining attenuation in the high frequency area.
- **TM:** Low DC resistance HM version.
- **TS:** Reduced DC resistance version for noise countermeasures around LSI power supplies.

EMI Suppression Ferrite Chips and Arrays

BLM02A, BLM03A, BLM15A, BLM18A and BLM21A Series - For General Use: BLM-A Series generates an impedance from the relatively low frequencies. Therefore BLM-A Series is effective in noise suppression in the wide frequency range (30MHz ~ several hundred MHz).

BLM03B, BLM15B, BLM18B and BLM21B Series - For High Speed Signal: BLM-B Series can minimize attenuation of the signal waveform due to its sharp impedance characteristics. Various impedances are available to match signal frequency.

BLM15E, BLM18E, BLM15H and BLM18H Series - For GHz Range Noise Suppression:
BLM-H/E Series has horizontal wire wound structure that minimizes stray capacitance and increases the effective frequency range.

BLM15G Series - For High Frequency Noise Suppression over a Wide Frequency Range

BLM18K Series: Can be used in high current circuits due to its low DC resistance.

BLM03P, BLM15P, BLM18P, BLM21P, BLM31P, BLM41P and BLM18S Series - For Large Current: BLM-P/S Series can be used in high current due to its low DC resistance. It can match power lines to a maximum of 6A DC.

BLM18R Series: Can be used in digital interface.

BLA2AA and BLA2AB Series: The BLA2AA/AB Series provides attenuation across a broad frequency range. Two types of impedance characteristics are available, one is for the general signal lines and the other is for high speed signal line. The BLA2 Series original inner electrode structure enables extra low crosstalk.

BLA31A and BLA31B Series: The BLA31A/B is capable of filtering 4 circuits in a 3216 package size. BLA31A/B is suitable for EMI suppression in smaller digital equipment.

LC Combined Chip EMIFIL®

NFL18ST Series: The NFL18ST series is an EMI suppression filter for high speed signal lines, achieving T-type structure in 1.6 x 0.8mm size with Murata's multilayer technology. Noise suppression for video signal lines (RGB lines) and high speed clock lines.

NFL21S Series: Murata's original internal structure design enables excellent noise suppression up to high frequencies. Available in five different values of cut off frequency ranging from 20MHz up to 500MHz.

NFW31S Series: The signal line chip EMI filter NFW31S series consists of high performance EMI suppression filters LC combined wound type. They are designed for noise suppression in high speed signal digital circuits in which the signal harmonics are prone to becoming noise sources. These filters achieve a 100dB/dec. (typical) damping characteristic with Murata's innovative circuit design. This makes these chips effective in applications where the signal and noise frequencies are close to each other.

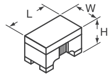
Common Mode Chokes - Series 05



Steward's Series 05 Common Mode Chokes provide excellent filtering capabilities for workload speeds of 25 ~ 480 Mb/s. Series 05 Common Mode Chokes handle filtering for bandwidth-hungry data lines in USB 2.0 designs. By using these parts on data lines (D+ and D-), they will suppress common mode noise without affecting the integrity of the differential signal. Low normal mode impedance allows signals to pass. Available in package size EIA 0805.

Applications:

• USB 2.0 • Broadband • Video applications • Imaging • High density storage devices • Low normal mode impedance

Differential Mode Multi-Line Arrays for Power EMI Filtering

3, 4, 5, and 8 Line Filters Rated up to 10 Amps Continuous Operation

Fig. 1 – Surface Mount (R)

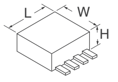

Fig. 2 – Through Hole (T)

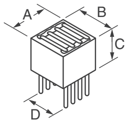

These multi-line ferrite products provide economical EMI filtering of differential mode noise in surface mount and through hole PCB applications. They are designed to provide high frequency suppression of both common and differential mode EMI noise on groups of data/power lines. The surface mount differential mode EMI filters are rated for up to 9 Amps continuous operation per filtered line (channel) and the through hole filters are rated up to 10 Amps continuous operation per line. Rugged construction provides protection against transient events as well as much higher peak current handling capability than most other EMI suppression devices. Low DCR.

Ferrite EMI Disks and Plates with Adhesive

RoHS COMPLIANT

Steward's Ferrite Disks and Plates provide a simple, cost-effective solution for radiated and inductively coupled electromagnetic interference. After the PC board soldering process, a ferrite disk or plate can be installed directly on the source of EMI (such as active devices or unwanted antennas). Can also be utilized either as inductively-coupled components or EMI shields on PC board components and traces.

Inductive coupling occurs when the ferrite affects the conducted wave form leading the active component. The rise time of the wave form is effectively slowed by the ferrite, and the overshoot and associated ringing are attenuated. EMI shielding occurs when the ferrite absorbs the radiated EMI emissions from active components, effectively protecting other boards or components in the vicinity from radiated contamination. Performance varies with each application.

Features: • Parts have 3M VHB double-sided permanent adhesive • Can be used to locate unwanted EMI antennas • Flat Flex and Ribbon Cable Shields • Provides retrofit auxiliary EMI attenuation

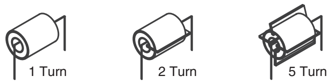
Ferrite EMI Cores for Cables and Wiring Harnesses

Low Frequency (300kHz ~ 30MHz)

Cores for Round Cables

Steward LFB ferrite material provides excellent impedance at lower frequencies.

Optimum EMI attenuation is between 300kHz and 30MHz, however, with additional wire turns, much broader EMI frequencies can be effectively attenuated.



Additional wire turns will multiply impedance.

Ferrite Cylinders and Toroids for Electromagnetic Interference (EMI)

Broad Band (optimized 30MHz ~ 800MHz +) Bead Cores for Round Cables and Wire Bundles

Fig. 1

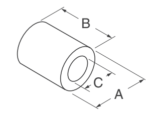

Fig. 2

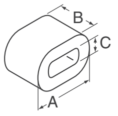

One-piece ferrite tubular bead cores for effectively attenuating a broad range of conducted and radiated electromagnetic interference (EMI). Install over round cables or wire bundles. Ferrite beads can be over molded or covered with heat shrink coating if desired. Additional wire turns will multiply impedance. Steward's cylindrical beads for round cables in Broad Band 28 material provide the smallest and most cost effective EMI solution when filtering both common mode and differential mode EMI on internal and external cable assemblies. By using Steward's high performance material, one is able to use the smallest and lowest weight core size possible with the highest EMI attenuation performance available.

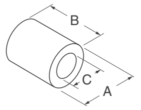
Ferrite Cylinders and Toroids for Electromagnetic Interference (EMI)

High Frequency (300MHz ~ 2GHz) Cylindrical Cores for Round Cables



Made from special high frequency material, these ferrite cylinders and toroids have EMI attenuation (impedance) that peaks above 1GHz for most part sizes. Also available in split clamp-on shapes (in plastic cases) listed at the bottom of this page. Size and shape of the part can affect performance and frequency response.

Clamp-On, Split Ferrite Cores in Plastic Cases for Round Cables and Wire Bundles

RoHS COMPLIANT

Split ferrite bead cores in clamp-on (or snap-on) plastic cases can be easily used for EMI attenuation where one-piece cores cannot be installed. Clamp-on cores are also convenient for use during EMI testing. Cylinder, round and box shaped plastic cased part shapes available. Additional wire turns will multiply impedance. High performance material.

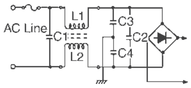
Circuit Example



Line filters for suppressing conductive noise ranging from low to high frequencies generated from power supply circuits of various equipment

V Series (Vertical Structure): Excellent attenuation in high frequency characteristics
H Series (Horizontal Structure): Greatly decreases leakage flux
F Series (Thin Structure): 15 mm height max.
M Series (Small Structure): Small size and lightweight
N Series (Vertical Structure): Suitable for high-density automatic insertion
High N Series (High L Structure): High inductance (same size with N Series)

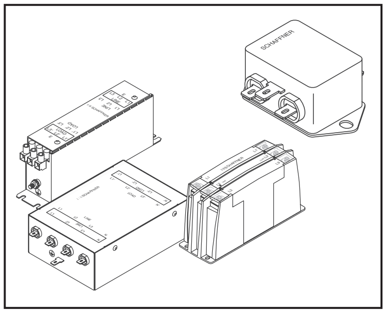
EMC / RFI Filters



Single-Phase Filters

Single-phase EMC/EMI filters for chassis or DIN rail mounting are key for EMC compliance of higher power office equipment and low to medium power industrial applications. A broad selection of electrical and mechanical features allows a specific choice and deployment for countless applications.

Three-Phase Filters

EMC/EMI Three-phase filter solutions for industrial applications like motor drives and machine tools. These types of EMC/EMI filters are also suitable for mainframe computer systems, large uninterruptible power supplies, medical equipment, wind turbine power stations and a vast array of other three-phase power electronics.

Corcom Power Entry Modules

C Series: A two-function power entry module combining a DPST switch and an IEC 320 power line connector.
CU Series: This series provides power entry for equipment designed for popular 1U (13/4") height equipment racks. The filtered versions provide completed shielding, shrouded quick connect terminals and basic filtering for 1A ~ 15A applications, in extremely compact size.
GG Series: The power entry modules combine the functions of a general purpose RFI filter with IEC power cord connector and single or dual metric fusing, in the smallest possible panel space.
HG Series: A medical version of our GG series, these filters offer the same compact design but reduce the line-to-ground capacitance in order to meet UL2601 patient care requirements.
P Series: This series of power entry modules offers full flexibility of design in the most compact package. As the first 10 Amp module to provide all five power entry functions in one compact design, the "Chameleon" readily adapts to its environment and the needs of international markets. • Snap-in or flange mounting • IEC power line connector • Both North American and European fusing capabilities • Two voltage selections • Optional DPST on/off switch • Filtering options for general purpose, high performance and medical applications.
J Series: The most widely accepted of all the power entry modules, the J series combines an IEC connector, 2 voltage, or 4 voltage selection, and a North American fuse holder.
L Series: The power entry modules are compact units that combine a multi-function power entry module and high performance RFI filtering capabilities. They are available with either a four voltage selector or a DPST on/off switch.
LA Series: A multi-function power entry connector with a choice of filtering capabilities. The series features an IEC line connector, selectable North American or dual European fusing capabilities, DPST on/off switch and 120/240 voltage selection. The filtered LA units provide a one piece solution to all power entry needs and provide a filtering solution for almost any RFI problem. Their vertical design is flange mounted and will meet requirements for worldwide markets.
M Series: This series of power entry modules offers the most choices of power entry components and filtering options to fit a specific need.
SR Series: Includes a full line of popular AC receptacles. These male and female power line connectors include snap-in and flange mounted models. All have complete safety agency approvals for worldwide usage.

Corcom RF Line Filters

3 Phase RFI Filters

RoHS COMPLIANT

A Series: The 3-phase filters are designed for 3-phase, four wire, WYE applications providing filtering in each of the three lines plus the neutral and ground line **AYO Series:** The AYO series filters are designed for 3-phase, four wire, WYE applications providing filtering in each of the three lines plus neutral. These lower current RFI filters provide filtering to industrial 3-phase applications. **BCF Series:** The 3-phase filters are designed for universal applications where reduced size is critical. It is ideal for all industrial 3-phase applications requiring very high attenuation in the frequency range between 100kHz ~ 30MHz.

General Purpose RFI Filters

RoHS COMPLIANT

B Series: These general purpose common-mode RFI power line filters effectively provide RFI control of line-to-ground noise in a small size at a low cost.
DK Series: The DK series RFI power line filters are general purpose common mode and differential mode filters with higher performance line-to-line attenuation than the VK series.
EMC Series: The EMC series of RFI filters has been developed to reduce conducted noise to acceptable limits for equipment that must comply with the requirements of CISPR in Europe and the FCC specifications in the USA. The EMC series was designed to address the need for more differential mode attenuation in the lower frequency range while still maintaining high common mode performance. This type of performance is typically needed for motor drives and switch mode power supplies with increased operating frequencies.
EP/VP Series: The EP/VP series of RFI filters has been developed to reduce conducted noise to acceptable limits for equipment that must comply with requirements of CISPAR in Europe and the FCC specifications in the USA.
FC Series: The FC filters provide filtering for frequency inverters and variable speed motor drives. Designed for very noisy applications, they attenuate conducted interference at low and high frequency ranges and protect programmable logic controllers from RF noise on the AC power line.
G Series: The G series RFI filters are designed to provide excellent common-mode and differential-mode attenuation for most digital electronic equipment (particularly switching power supplies) over the frequency range of 20kHz ~ 30MHz.
K Series: These power line filters are general purpose common-mode and differential-mode filters. They are effective in the control of line-to-line as well as line-to-ground RFI interference. They are particularly suited in applications where pulsed, continuous and/or intermittent RFI interference is present.
N Series: The N series RFI filters are designed to provide superior common-mode attenuation for most digital electronic equipment (particularly switching power supplies) over the frequency range of 10kHz ~ 30MHz.
Q Series: A series of RFI power line filters that has been developed specifically for switching power supplies and is designed to be all the power line filtering needed to control conducted emissions all the way down to 10kHz.
R Series: These dual T section RFI power line filters provide premium performance at a moderate cost. They are well suited for low impedance loads where noisy RFI environments are present. They control pulsed, continuous and/or intermittent interference, insuring protection of your equipment from line power noise in addition to protecting the line from equipment noise.
RK Series: The RK Series filters are compact, single stage, chassis mount filters that provide significant differential mode performance ideal for industrial machinery equipment. Low input leakage current makes this series suitable for portable equipment.
S Series: The S series of RFI power line filters combines successful line-to-ground interference rejection filters with additional circuitry designed to reduce line-to-line noise and transients.
SK Series: This series of RFI power line filters was designed to reduce conducted noise to acceptable limits for equipment that must comply with the FCC specifications in the USA and CISPAR specifications in Europe.
T Series: These RFI power line filters provide superior common-mode and premium differential-mode attenuation, exceeded only by that of Q series filters.
U Series: The U series was designed to meet the RFI needs created by power factor corrected power supplies. This high performance filter offers a high impedance circuit to mismatch the power supply's impedance characteristics.
V and W Series: These RFI power line filters will protect equipment from malfunctions due to conducted interference coming into the equipment from the line, especially line-to-line noise and transients. The W series has a two-stage construction that provides excellent suppression at high frequency.

Corcom RF Line Filters *(Cont.)*

Medical Grade Filters

EAH Series: This is a new generation of compact medical RFI filters with an IEC socket. A new design in internal structure and manufacturing process makes the series cost effective. This health care series supersedes the H series by providing superior differential mode performance while still maintaining a maximum leakage current of 2 micro amps.

EBH Series: A compact medical RFI filter with IEC socket, the EBH series is a cost effective alternative to the H series. Electrically the EBH provides enhanced differential mode performance compared to both the EAH and the H series. These filters provide RFI common and differential modes performance while still allowing medical equipment to meet UL leakage current specifications for medical and dental equipment.

EJH Series: The 1 ~ 15 Amp versions are flange mounted and mechanically equivalent to the EAH/EBH series. The performance has been enhanced to meet the needs for more attenuation. It has an improved high frequency EMI shielding and larger contact area for the panel ground. These medical filters are designed to provide common and differential mode performance while maintaining the UL leakage requirements for medical and dental equipment. The EJH series also includes a 20 Amp version that uses the inlet IEC 320/C20.

H Series: The H series was developed specifically for health care applications. These products are suitable for uses in both patient care equipment and non-patient care equipment. Their extremely low leakage current allows compliance with UL2601 and CSA 22.2 health care specifications.

HT Series: This series of power line filters provides superior common-mode and premium differential-mode attenuation to RFI noise on the frequency range from 10kHz ~ 30MHz, for IEC60601 and UL2601 patient-connected equipment, as well as all other electronic equipment that cannot tolerate any leakage current.

HQ Series: The HQ series power line filters provide the highest available common-mode and differential-mode attenuation to RFI noise in the frequency range from 10kHz ~ 30MHz, for IEC 60601 and UL2601 patient-connected equipment, as well as all other electronic equipment that cannot tolerate any leakage current.

MV Series: This series answers the need for a medical filter to help equipment comply with increasing noise sources in medical applications while still meeting leakage current requirements of UL2601.

DC Filters

DA Series:

The DA series filters were designed as general purpose line filters for DC applications up to 125VDC. They are compact with a 3-pin inlet connector. The DA series addresses the increasing need for DC rated filters with a standard DC power inlet. Any internal DC connection within larger multi-component systems, or external DC connection between user installed components which require filtering will benefit.

DB Series:

The DB series power inlet filters are available in four levels of filtering and an unfiltered version, these inlets are designed to accept up to 60A of current at 150VDC (UL/CSA) and 120VDC (TUV) in the filtered versions and 300VAC or DC in the unfiltered version. Filtered versions include the basic clean-up DBJ style through the higher performing DB style and DBX style which provideds up to 68dB insertion loss within the 150kHz ~ 30Mhz frequency range.

DC Series:

The DC series filters were designed as general purpose line filters for DC applications. They are available with or without circuit breakers for extra protection. These filters are generally used in central office equipment like switches, routers, and hubs to clean up the 48VDC power, but are not exclusive to that equipment. They can also be used at the primary input of the DC power supply.

IEC Inlet Line Filters

EAS Series: This filter offers the performance characteristics of the EEA susceptibility filter with the additional advantage of a snap-in panel mount. The EAS series supersedes the EF series by providing superior performance, particularly in the common mode at low frequencies.

EBF Series: The EBF accessory outlet filters provides an innovative means of connecting accessories while filtering noise between a system and the accessories attached. These filters provide enhanced performance utilizing common mode inductance and differential mode capacitance for enhanced attenuation of noise across the frequency range. The filtered connector offers the additional advantage of a grounded connection and features low leakage current required for international usage.

EBS Series: This filter offers the performance characteristics of the EEB susceptibility filter with the additional advantage of a snap-in panel mount.

EC Series: This series of filtered power entry modules provides the highest attenuation of any standard filter available in a package size limited by the dimensions of the integral IEC connector. These filters combine high common-mode inductance with high differential-mode capacitance and minimal parasitic elements, for effective attenuation of line-to-ground and line-to-line noise across the frequency range.

ED Series: These filtered power entry modules are more effective than general purpose filters in applications where line-to-line and low frequency line-to-ground noise must be controlled.

EEA Series: A new design in both the internal structure and manufacturing process makes this series cost effective and compact.

EEB Series: This is a compact RFI filter with IEC socket. A new design in both the internal structure and manufacturing process makes this series cost effective and compact. Electrically, the EEB provides enhanced differential mode performance compared to both the EEA and EF series. Mechanically, its slimmer size makes it compatible with all similar filters on the market.

EEJ Series: The 1 ~ 15 Amp versions are snap-in mounted and mechanically equivalent to the EEA/EEB series. The performance has been enhanced to meet the needs for more attenuation. It also has an extended metal flange around the socket for improved high frequency EMI shielding. The EEJ series also includes a 20 Amp version that uses the inlet IEC 320/C20.

EF Series: This rugged international series of filtered power entry modules incorporates the special IEC power line connector. They are UL recognized, CSA certified, and VDE and SEV approved. Models with F suffix are SEMKO approved and comply with BSI standards.

EJS Series: The 1 ~ 15 Amp versions are snap-in mounted and mechanically equivalent to the EAS/EBS series. The performance has been enhanced to meet the needs for more attenuation. It has improved high frequency EMI shielding. The EJS series also includes a 20 Amp version that uses the inlet IEC 320/C20.

EJT Series: The EJT Series is a power inlet filter designed to attenuate noise up to 1 GHz. This inlet uses an IEC 320/C14 input connector. This product was designed to address the demand for more noise attenuation at higher frequencies in a compact inlet.

SRB Series: The SRB series is one of the smallest depth available on the market, it features a complete shield design with various capacitance values. The SRB series is rated up to 15A, 250VAC, 10A VDE. This product is ideally suited for power supplies or other applications which require a minimum depth low cost solution.

SRB Series (Slide-in Mount): This addition to the SRB Series filter features a unique, panel mounting option. This new "slide-in" mounting approach provides a simple, cost-effective installation method, reducing the need for additional mounting hardware.

NESSCAP TURBO-POWER Ultracapacitors and Pseudocapacitors

RoHS COMPLIANT

The NessCap **Ultracapacitor (ESHSR Series)** is an Electric Double Layer Capacitor (EDLC) that uses an activated carbon powder and coating process to prepare electrodes. The NessCap ultracapacitor's high energy density is made possible through the use of a proprietary binder formulation and specially developed electrode-making process.

The NessCap **Pseudocapacitor (PSHLR Series)** differs from the EDLC in that it uses a metal oxide rather than an activated carbon for electrode material. With this advantage, pseudocapacitor cell needs to be only 60% in volume as compared to an EDLC of the same capacitance. Conversely, it also means the pseudocapacitor holds 80% more energy than the equivalent-size EDLC.

TAIYO YUDEN High Capacitance PAS Capacitors

Digi-Reel® RoHS COMPLIANT

PAS *(Polyacenic Semiconductor)* which was originally developed by Shoei Electronics *(now a Taiyo Yuden owned company)*, is a kind of conductive polymer, synthesized through pyrolytic treatment of phenolic resin. When PAS is employed for both positive and negative electrodes, it shows extremely high performance. The capacitors are 1/2 ~ 1/3 smaller than conventional electric double layer capacitors and its low internal resistance enables quick charging and large current discharging. **Features:** • *High Capacitance:* PAS can store a large number of ions into its amorphous structure (doping), which gives them much more capacitance than conventional electric double layer capacitors • *Quick Charge & Discharge:* These capacitors can be charged and discharged quickly due to low internal resistance • *High Reliability:* It's possible to charge/discharge the capacitors more than 100,000 times with less deterioration, compared to a secondary battery

AVX

BestCap® Ultra-Low ESR

High Power Pulse Supercapacitor

Features: AVX's BestCap technology provides excellent high power pulse characteristics based upon the combination of very high capacitance and ultra-low ESR, together with extremely low leakage current. Based on a unique patented aqueous chemistry and an innovative design, this series offers high capacitance, even with short pulse applications such as in GSM, GPRS, Edge, and PCS based systems. While BestCap technology offers more efficient energy savings in battery circuits than conventional supercapacitors, its low ESR results in a high current handling capability, making this an ideal solution for any portable or wireless device requiring high power availability. **Specifications:** • Capacitance Tolerance: -20% ~ 80% • Temperature Range: A Series: -20°C ~ 75°C; B Series: -20°C ~ 70°C

NEW! 380LX and 382LX 85°C High Capacitance Snap-In Capacitors

The excellent value of the 380LX and 382LX capacitors find application in switching power supply input and output circuits and even motor drives where the high surface area of multiple units in parallel give high ripple current capability. The 382LX series also comes in 4 or 5 pin cans for stable, reverse proof mounting.

Specifications: • Operating Temperature Range: -40°C ~ 80°C up to 300Vdc, -25°C ~ 85°C ≥315V • Leakage Current: $\leq 3\sqrt{CV}$ µA at 5 min.

NEW! 383LX 105°C High Ripple Snap-In Capacitors

Adding longer life and more ripple capability to the excellent value of the 380LX and 382LX series capacitors, the 383LX readily handles tough switching power supply input and output circuits and motor drive bus capacitor applications where the high surface area of multiple units in parallel give high ripple current capability. The 383LX series come in 4 or 5 pin cans for stable, reverse proof mounting.
Specifications: • Operating Temperature: -40°C ~ 105°C up to 315Vdc, -25°C 350Vdc and up • Leakage Current: ≤3√CV µA

A700 Series AO-CAP Aluminum Organic Capacitors

KEMET's AO-CAP, designated the A700 Series, has been targeted for power management applications. The structure of the AO-CAP uses aluminum as the anode material, aluminum oxide as the dielectric, and a conductive organic polymer for its counter-electrode material. The AO-CAP offers many advantages: • Extremely low ESR • High capacitance retention for superior performance at high operating frequencies • No voltage derating up to 125°C • Robust to the surface-mount process • No dry-out-related failure mechanism

The A700 Series has a molded case and wraparound terminations. This provides strong protection against cracks (flex) making it an ideal alternative to high-capacitance ceramics, and also offers true surface-mountable solutions to the existing aluminum organic capacitors found in the industry. The high-frequency performance of the AO-CAP can reduce component counts, which allows the designer to save board space and offers a more cost-effective solution.

The AO-CAP has excellent surge current performance and long-term reliability. There is no recommended derating of application voltage to reduce failure rate.

Operating Temperature: -55°C ~ 125°C The approximate capacitance shift over the temperature range for -55°C is -15%, and for 125°C is +15% **Capacitance Tolerance:** ±20%

AVRF Series Aluminum Electrolytic Capacitors (SMT) —
Low Impedance and Long Life -55°C ~ 105°C

The AVRF Series is a low impedance and long life capacitor for filtering, by-passing, and power supply decoupling. It excels at cold performance down to -55°C and is at a significant cost savings compared to tantalum (as well as similar impedance characteristics to low ESR tantalums). The vertical cylindrical cases facilitate automatic mounting and reflow soldering into the same footprint of like-rated tantalum capacitors except without the need for voltage derating. **Specifications:** • Operating Temperature Range: -55°C ~ 105°C • Leakage current: 0.01CV or 3µA @ 20°C, after 2 minutes (whichever is greater)

The AVEK Series capacitors are rated for 5,000 hours at 105°C with low impedance characteristics. They are ideal for high density PC board packaging. This series offers a low in-place-cost for a high quality performer. The vertical cylindrical cases facilitate automatic mounting and reflow soldering into the same footprint of like-rated tantalum capacitors except without the need for voltage derating. **Specifications:** • Operating Temperature Range: -55°C ~ 105°C • Leakage Current: 0.01CV or 3µA @ 20°C for 2 minutes (whichever is greater)

TWA Series Wet Tantalum Capacitors

The TWA wet electrolytic tantalum capacitor represents a new level of capacitance and voltages, previously unachieved. It incorporates a novel, very high capacitance cathode system that allows for higher CV designs. All TWA products are built to the 93026 specification which includes the harsh shock and vibration requirements of 39006. This design includes a welded tantalum can and header assembly that provides a hermetic seal to withstand harsh environments. • **Capacitace Tolerance**: ±10% • **Operating Temperature:** -55°C ~ 125°C

TPS Series Low ESR Surface Mount Tantalum Capacitors

TPS surface mount products have inherently low ESR (equivalent series resistance) and are capable of higher ripple current handling, producing lower ripple voltages, less power and heat dissipation than standard product for the most efficient use of circuit power.

TPS has been designed, manufactured, and preconditioned for optimum performance in typical power supply applications.

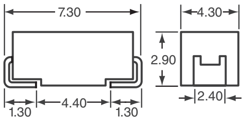
AVX TAW Series – Fused Tantalum Capacitors



RoHS COMPLIANT

Digi-Reel®

The TAW fused tantalum capacitors offer protection from possible damaging short circuit failure modes. This is accomplished with an internal fuse using thin film technology that is in series with the capacitor. The AVX fused tantalum offers lower ESR limits than competitive fused tantalum capacitors.

TRJ Series Professional Tantalum Chip Capacitors

The TRJ surface mount series employs established tantalum technology together with new process improvements and advanced manufacturing techniques. This robust series enables extension of the guaranteed 0.5% reliability level to 1000 hours at rated voltage, rated temperature, and 0.1Ω/volt circuit impedance. The moisture penetration barrier, thicker external dielectric layer, and modified manganising process make the capacitor more robust against higher thermo-mechanical stresses during assembly process and also more robust against more severe working conditions in Automotive, Medical, Aerospace, Military, and other applications. Lower ESR options are now available within the professional TRJ while achieving reliability levels twice that of standard tantalum devices. This enables designers of power supplies in long life expectancy applications to use tantalum capacitors with the combined benefits of enhanced reliability and low ESR.

TAC and TPC Series — Standard Microchip Surface Mount Tantalum Capacitors

TAC Series: The world's smallest surface mount tantalum capacitor, small enough to create space providing room for ideas to grow. TACmicrochip™ is a major breakthrough in miniaturization without reduction in performance. It offers the highest energy store in a small case down to 0402. Enhanced high frequency operation through unique ESR performance with temperature and voltage stability also offered. **TPC Series:** Offers lower ESR feature to TACmicrochip® solid tantalum capacitors. The low ESR TPC capacitors improve performance of power supplies in miniature case sizes such as 0603 and 0805.

OxiCap™ Niobium Oxide Capacitors

Cost versus performance is a key requirement for consumer electronic products. A solid electrolyte capacitor OxiCap has been developed by AVX in standard EIA case sizes in order to meet this requirement as a higher performance alternative to aluminum and other SMT capacitor technologies currently on the market. The OxiCap non-burn technology is based on NbO niobium oxide ceramic material as the anodic material processed through the same manufacturing process as tantalum capacitors. The laser coded orange molded body gives total traceability.

Tantalum Dipped / Radial Capacitors

T350 and T356 "UltraDip II" Series

The KEMET "UltraDip II" Series, miniature dipped solid tantalum capacitors, provide the designer with the advantage of compactness plus low leakage and low DF performance characteristics for filtering, bypassing, coupling, blocking and RC timing circuits.

The plastic case provides a tough barrier coating and maintains precision of lead wire spacing within ±0.015 inch.

All case sizes are printed with capacitance, voltage, polarity and vendor identification, these self-insulating cases are resistant to shock and vibration.

The gold color epoxy permits Laser marking with outstanding permanency and legibility.

Solid tantalum devices exhibit no degradation failure mode during shelf storage.

These capacitors exhibit low DCL, ESR and Impedance and have excellent temperature stability. *The ESR values provided are for reference only.*

- **Operating Temperature:** -55°C ~ 85°C (125°C with voltage derating)
- **Capacitance Tolerance (%):** ±10

Surface Mount Tantalum Chip Capacitors

KEMET's family of solid tantalum chip capacitors are designed and manufactured with the requirements of surface mount technology in mind. These devices extend the advantages of solid tantalum technology to today's surface mount circuit applications.

Operating Temperature Range: -55°C ~ 125°C (T520 Series: -55°C ~ 105°C, T498 Series: 150°C, T499 Series: 175°C)

T491 Series — Industrial: The leading choice in surface mount designs. This product meets or exceeds the requirements of EIA standard 535BAAC. The physical outline and dimensions of this series conform to this global standard. This product was designed specifically for highly automated surface mount processes and equipment.

T494 Series — Low ESR, Industrial Grade: The T494 is a low ESR series that is available in all the same case sizes and CV ratings as the T491 Series. The T494 offers low ESR performance with the economy of an industrial grade device. This series is targeted for output filtering.

T495 Series — Low ESR, Surge Robust: Designed primarily for output filtering in switch-mode power supplies and DC-to-DC converters. The standard CV T495 values are an excellent choice for battery-to-ground input filter applications. This series offers several important advantages: Very low ESR, high ripple current capability, excellent capacitance stability and improved ability to withstand high inrush currents.

T496 Series — Fused: KEMET also offers a "fail-safe" fused solid tantalum chip capacitor. The built-in fuse element provides excellent protection from damaging short circuit conditions in applications where high fault currents exist. Protection from costly circuit damage due to reversed installation is offered with this device.

T498 Series — High Temperature (150°C): The T498 Series is a high temperature version of KEMET's solid tantalum chip family that offers optimal performance in applications with operating temperatures of up to 150°C. Advancements in materials and testing have allowed for the introduction of this series which delivers a reliability level of 0.5% per 1000 hours at rated voltage at rated temperature.

T499 Series — High Temperature (175°C): The T499 Series is a high temperature version of KEMET's solid tantalum chip family. This series is designed for use in applications with operating temperatures up to 175°C. This product offers the highest operating temperature capability in a surface mount tantalum device available in the market place.

T510 Series — Ultra-Low ESR: KEMET's T510 Series offers the industry's lowest ESR in the popular EIA 7343-43 case size. The ultra-low ESR and high ripple current capability make it an ideal choice for SMPS filtering and power decoupling. KEMET has developed an innovative construction platform that incorporates multiple capacitor elements, in parallel, inside a single package.

T520 Series — KO-CAP Polymer Tantalum: The KO-CAP is a tantalum capacitor, with Ta anode and Ta_2O_5 dielectric. A conductive, organic, polymer replaces the MnO_2 as the cathode plate of the capacitor. This results in very low ESR and improved cap retention at high frequency. The KO-CAP also exhibits a benign failure mode, which eliminates the ignition failures that can occur in standard MnO_2 tantalum types. KO-CAPs may be operated at voltages up to 80% of rated voltage with equivalent or better reliability than standard tantalums operated at 50% of rated voltage.

T521 Series — KO-CAP Polymer Tantalum: KEMET's T521 series capacitor is a surface mount polymer tantalum capacitor that has been designed to deliver low ESR, high capacitance and high volumetric efficiency in applications of up to 25V.

T525 Series — KO-CAP Polymer Tantalum: The T525 has been targeted for power management applications. This series offers all of the same advantages as the T520 KO-CAP including very low ESR, improved capacitance retention at high frequency and a benign failure mode, to go along with 125°C capability.

T528 Series — Face Down Termination Tantalum: The T528 is an organic tantalum chip capacitor with face down termination, that features Low ESL and has a wide tolerance range of ±20%.

T530 Series — KO-MAT Polymer Tantalum: The KO-MAT is an extremely low ESR, volumetrically efficient, organic tantalum chip capacitor that offers high capacitance retention while preventing thermal events (ignition failures). Organic polymer does not give up oxygen if the dielectric fails short, thus preventing ignition. Organic polymer is more conductive than MnO_2 — lower ESR.

Higher capacitance retention at higher frequencies means fewer parts are required to achieve the desired capacitance.

The KO-MAT allows tantalum capacitors to be used in circuits never considered possible before, such as input filters. Initial focus is for power supplies and microprocessor circuits.

SuperTan® Wet Tantalum Capacitors with Hermetic Seal
for -55°C ~ 125°C Operations — ST and STE Series

Vishay ST and extended STE represent a major breakthrough in wet tantalum capacitor technology. Their unique cathode system provides the highest capacitance per unit volume. The design facilitates a doubling of capacitance, lower ESR and higher ripple current rating compared with conventional wet tantalum products. Moreover, the ST (and STE) have the capacitance stability of a solid tantalum capacitor and there are no circuit impedance restrictions. The ST is housed in an all tantalum, hermetically sealed case and is manufactured to withstand hazardous environments. The ST is used widely in the defense and aerospace industries and whenever there is a space problem. The STE is exceptionally well suited for low voltage filtering and energy storage applications. It also is ideal for designs targeting the military and aerospace industry. **Features:** • Very High Capacitance • Very Low ESR • High Ripple Current • Low DCL **Performance Characteristics**: Operating Temperature: -55°C ~ 85°C (Up to 125°C with voltage derating) **Physical Characteristics:** • All Tantalum Case • Hermetically Sealed • Insulated • Tinned nickel leads (solderable and weldable)
